These pumps which are new to the line of Motor Service products combine a mechanical fuel pump and a vacuum pump in a single component.

Both components are accommodated on a common shaft and are driven by the camshaft. The fuel pump serves as a forepump for the pump and injector unit. The vacuum pump generates the vacuum for the brake booster, pneumatic actuators and servo applications.

Model examples

Fuel/vacuum pump in the VW Passat (highlighted in red)

The right of changes and deviating pictures is reserved. Assignment and usage, refer to the each case current catalogues, TecDoc CD respectively systems based on TecDoc.

\* The reference numbers given are for comparison purposes only and must not be used on invoices to the consumer.
